

Splice Kit Options

We offer Posi-Lock products for splicing head unit harnesses because they are well-known for superior quality and secure connections *without* special tools. Just strip the wires, insert, and twist the end caps. And they are reusable with no connection degradation - if you make an error reworking your splices is easy.

Posi-Twist Kit. Here is an example (only 4 wires spliced here) using the Posi-Twist connectors kit.

These budget connectors are easy to use but the wire bundle can get a little bulky after all the wires are connected.

Posi-Lock Kit - Below is the same 4 wires spliced using the Posi-Lock connectors. Because these are in-line connectors the wire bundle is smaller and easier to manage.

To make the wire bundle even smaller you can stagger the connectors with the Posi-Lock kit. This is accomplished by cutting half the harness wires long on the left and short on the right, and the other half short on the left and long on the right. This way half the connectors are offset for an even tighter wire bundle.
